

Connecting radios all over the world

SoftRadio SIP Phone

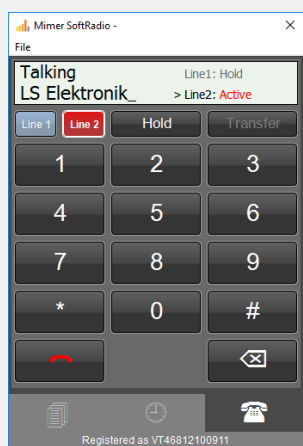

Mimer SoftRadio is a system to remote control two way radios over LAN, WAN or the Internet. The operator uses a standard Windows PC and standard audio accessories.

Each operator can handle many radios and each radio can be remote controlled by many operators.

With use of the **SoftRadio SIP Phone Option**, each dispatcher also gets access to a built in SIP phone client in the Mimer SoftRadio software.

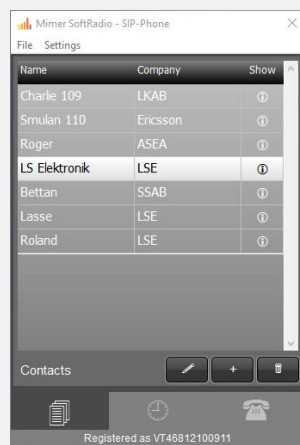

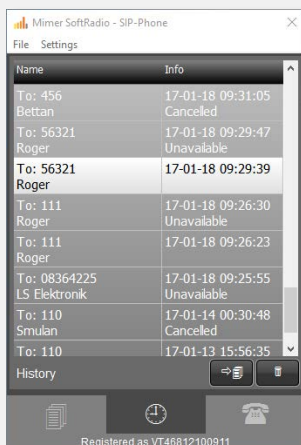

The dispatcher can answer incoming calls and make outgoing calls. There are two connections to each dispatcher so that one call can be put on hold while another call is serviced.

Depending on the functions in your SIP exchange the dispatchers can be programmed for individual phone numbers, group phone numbers etc.

*Keypad, History list
and Contact list*

The SIP client also includes a Contact list and a History list of all exchanged calls.

Phone Options to SoftRadio

With the option Mimer CrossPatch installed, radio calls and phone calls can be manually patched together.

Also analogue phone lines (POTS) and GSM modem phones can be connected to SoftRadio.

When using phones at the dispatcher a handset or a headset is recommended to avoid acoustic feedback.

SoftRadio with two radios and one SIP-phone

More info on SoftRadio, options and accessories are found on the web pages.
