

*Connecting radios all over the world*

## Mimer SoftLine - Icom Marineradio

**Mimer SoftLine Icom Marineradio** gives you the ability to remote control radios like the IC-M423, M506 or M400BB radio over long distances.

In situations where you need to remote control a radio over a long distance but don't want to have a PC as the dispatchers interface. Mimer SoftLine Icom Marineradio will give you the option to place the radio at one end of a TP-cable and the control head at the other end.

With a standard CAT5/CAT6 cable the distance can be up to 150m. Using standard IP infrastructure through LAN, WAN or the Internet you get an "unlimited" distance.

*Example of set up with Icom IC-M423 and Command Microphone*

There are also installation situations where copper wire can't be used between radio and control head. With this solution you can solve the problem by using a fibre connection.

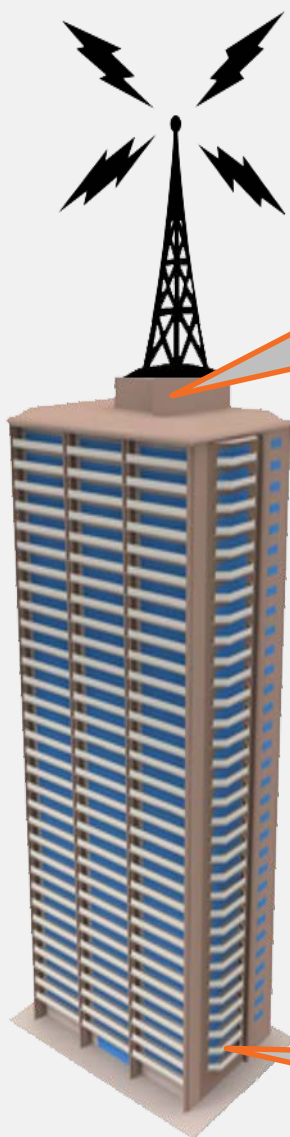

All the radios functions are available through the remote control.

## Markets

- Harbours
- Transportation
- Offshore
- Industry
- Coast Guard

## User example

A typical use is to have a local installed radio high up in a building and the Command Microphone at the ground floor. In this way you can have a short antenna cable for low loss.

Using the Internet you can also place the radio closer to the shore and therefor closer to the ships that you need to talk too.
